

## TRACKSTAR

*Locate items effortlessly using Google™ style searches with auto suggest capability.*

*Manage assets and secure their value.*

*Inventory at the touch of a button!*

*Better decision making!!*

### How it works!

RFID/RTLS tags are printed and either applied to or built into the product, person, paper or item of interest. Products are then instantly visible in the TrackStar system using a combination of short/long range devices and optional IP cameras.

The information is deposited into a database which powers the search, tracking, management and business intelligence reporting tools.

Users log into the system via a web browser or smart phone to perform searches and view dashboard reports to see real time information for their items of interest.

### Use Cases/Sectors Served
